Moderne hospitalsbehandling efter hjertestop

- Evidensbaseret? Njaøee.....
- Vi ved alt for lidt

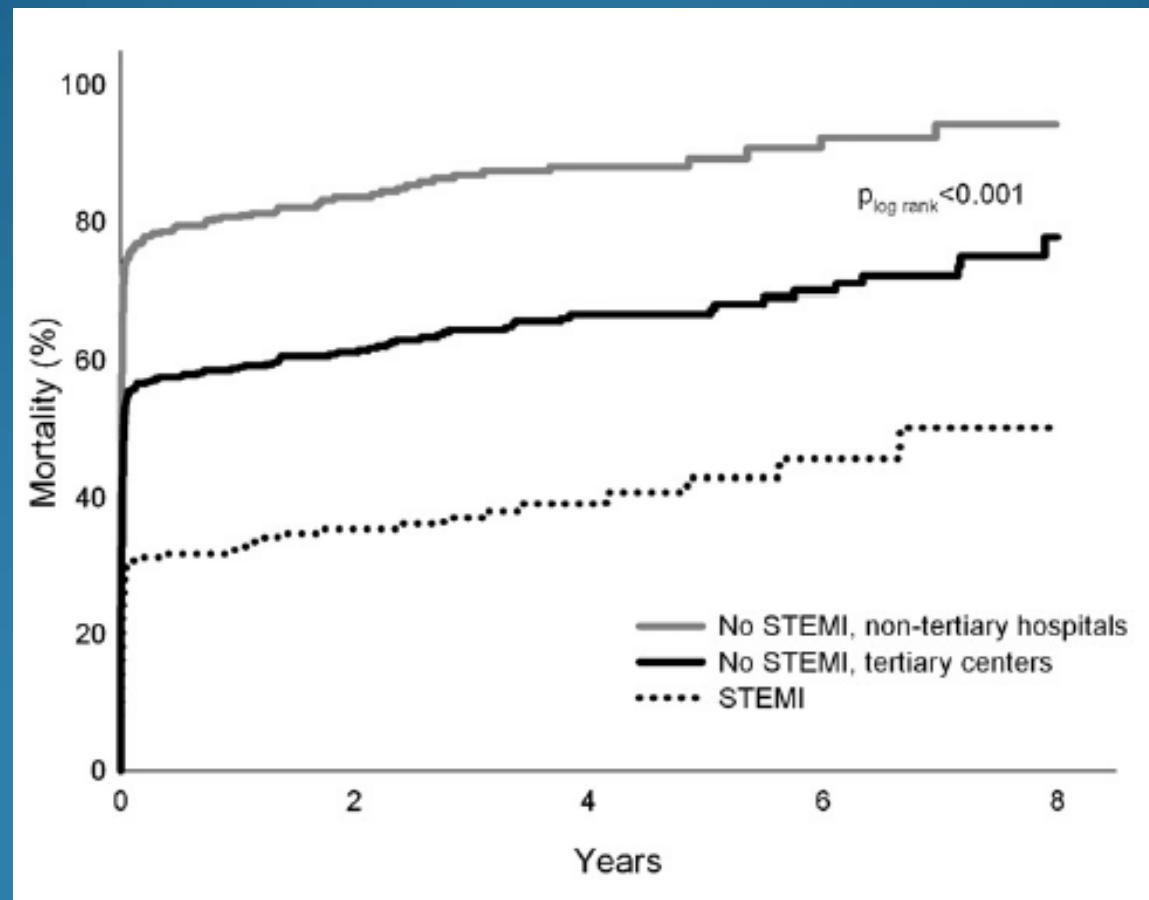

Hvad gør vi så....

- Sikre respiration
- Sikre perfusion
- Sikre homeostase iøvrigt
- Eventuelt antibiotika behandling
- Køler dem lidt ned
- Og ser hvad der sker.....

Tertiary centers or not for OHCA?

Tertiary centers or not for OHCA?

The study was carried out between March 1996 and January 2001. Since the enrollment rate was lower than expected and funding had ended by July 2000, enrollment was stopped at this date.

TREATMENT OF COMATOSE SURVIVORS OF OUT-OF-HOSPITAL CARDIAC ARREST WITH INDUCED HYPOTHERMIA

STEPHEN A. BERNARD, M.B., B.S., TIMOTHY W. GRAY, M.B., B.S., MICHAEL D. BUIST, M.B., B.S.,
BRUCE M. JONES, M.B., B.S., WILLIAM SILVESTER, M.B., B.S., GEOFF GUTTERIDGE, M.B., B.S., AND KAREN SMITH, B.Sc.

On the basis of our previous study,¹⁶ it was determined that a sample of 62 patients (31 in each group) would be required to show a change in the rate of a good outcome (discharge to home or to a rehabilitation facility) from 14 percent to 50 percent, with a power of 80 percent and a significance level of 0.05. An analysis of results from 62 eligible patients found that the outcome in the control group was better than our previously published rate,¹⁶ but that there was a strong trend toward improved outcome in the hypothermia group. The study was continued for a further 12 months, at which time 84 patients had been eligible for enrollment, 77 had been enrolled, and 72 had been treated according to the correct treatment assignment.

ILCOR Advisory Statement

Therapeutic Hypothermia After Cardiac Arrest

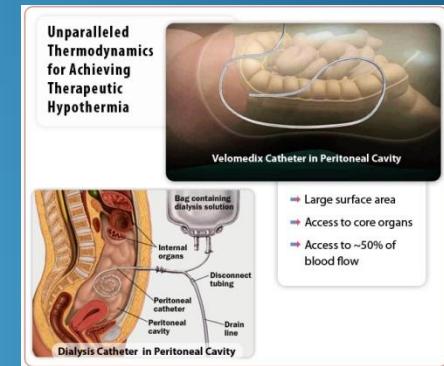

An Advisory Statement by the Advanced Life Support Task Force of the International Liaison Committee on Resuscitation

Summary: ILCOR Recommendations

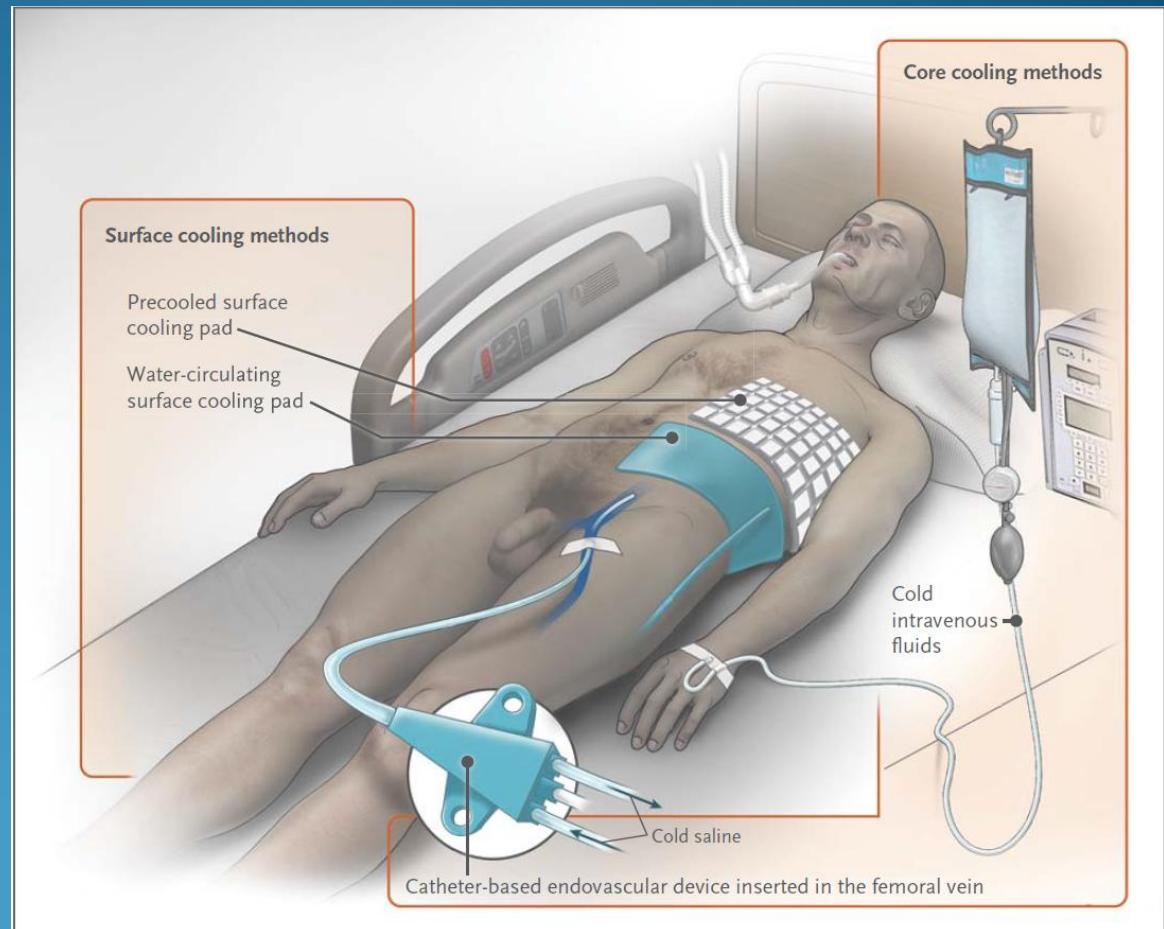

On the basis of the published evidence to date, the ILCOR ALS Task Force has made the following recommendations:

- Unconscious adult patients with spontaneous circulation after out-of-hospital cardiac arrest should be cooled to 32°C to 34°C for 12 to 24 hours when the initial rhythm was VF.
- Such cooling may also be beneficial for other rhythms or in-hospital cardiac arrest.

Main objective

- To assess the benefits and harms of a targeted temperature management at 33°C versus 36°C
- Avoiding fever in post-cardiac arrest patients in both groups

TTM-trial – 2010-2013

- 950 patienter blev randomireret
- 36 hospitals
- 10 countries
- Europe and Australia

Funded by:

Swedish Heart Lung Foundation

AFA-insurance Foundation, Sweden

Swedish Research Council

Governmental and Regional funding within the Swedish National Health System

Tryg Foundation, Denmark

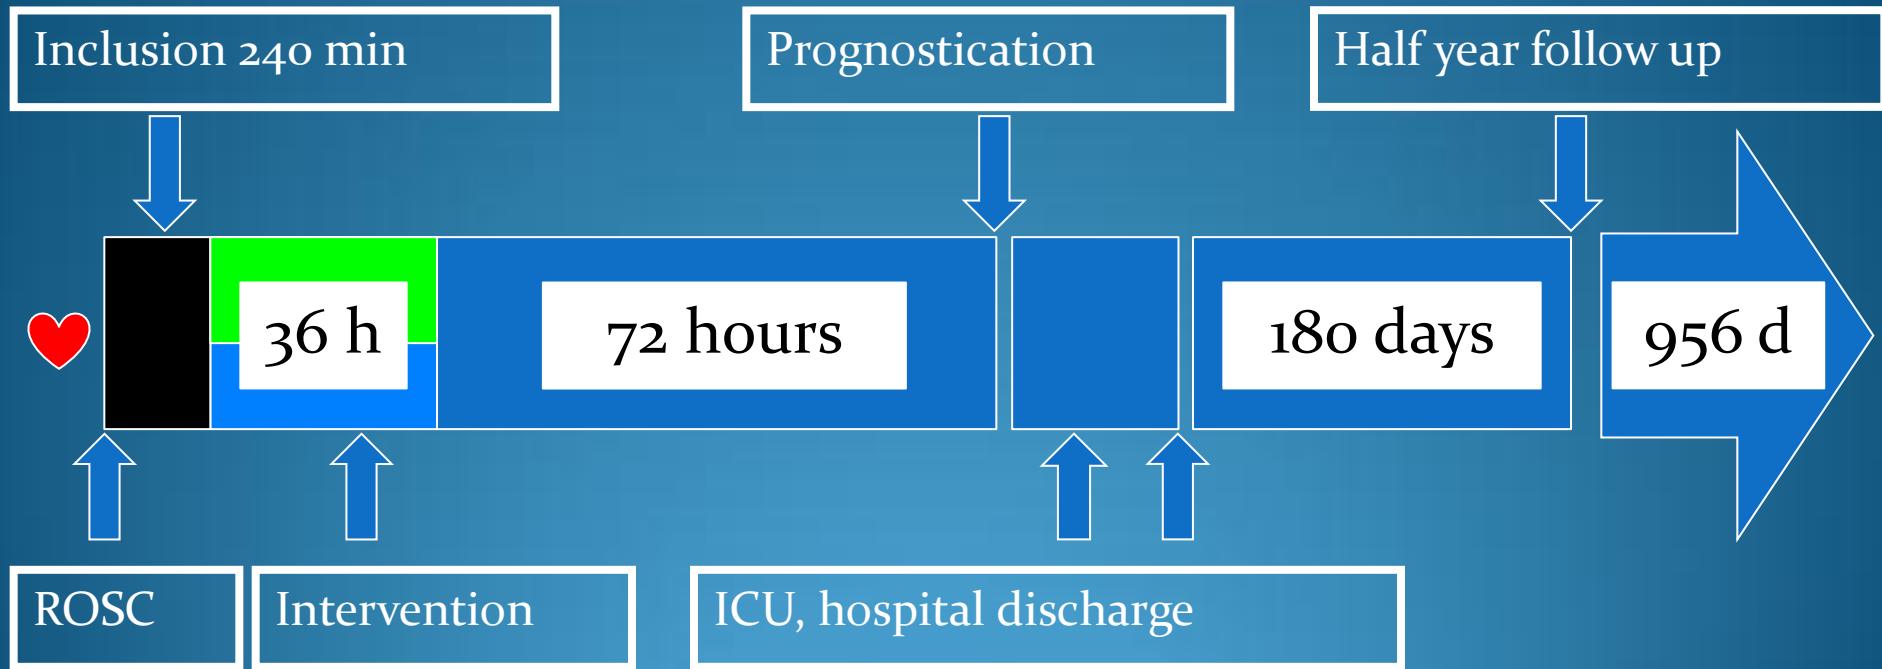

Zoega, Kropperup, Thure Carlsson, Trolle-Wachtmeister foundations, Sweden

Inklusions kriterier

- Hjertestop opstået uden for hospital
- ≥ 18 år
- Formodet kardiel årsag
- Alle hjerterytmer
- Bevidstløs (GCS<8)
- Stabil ROSC

Eksklusions kriterier

- Ubevidnet asystoli
- >240 minuter fra ROSC
- $T_p < 30^{\circ}\text{C}$
- Kendt eller mistænkt intracranial blødning og apopleksi

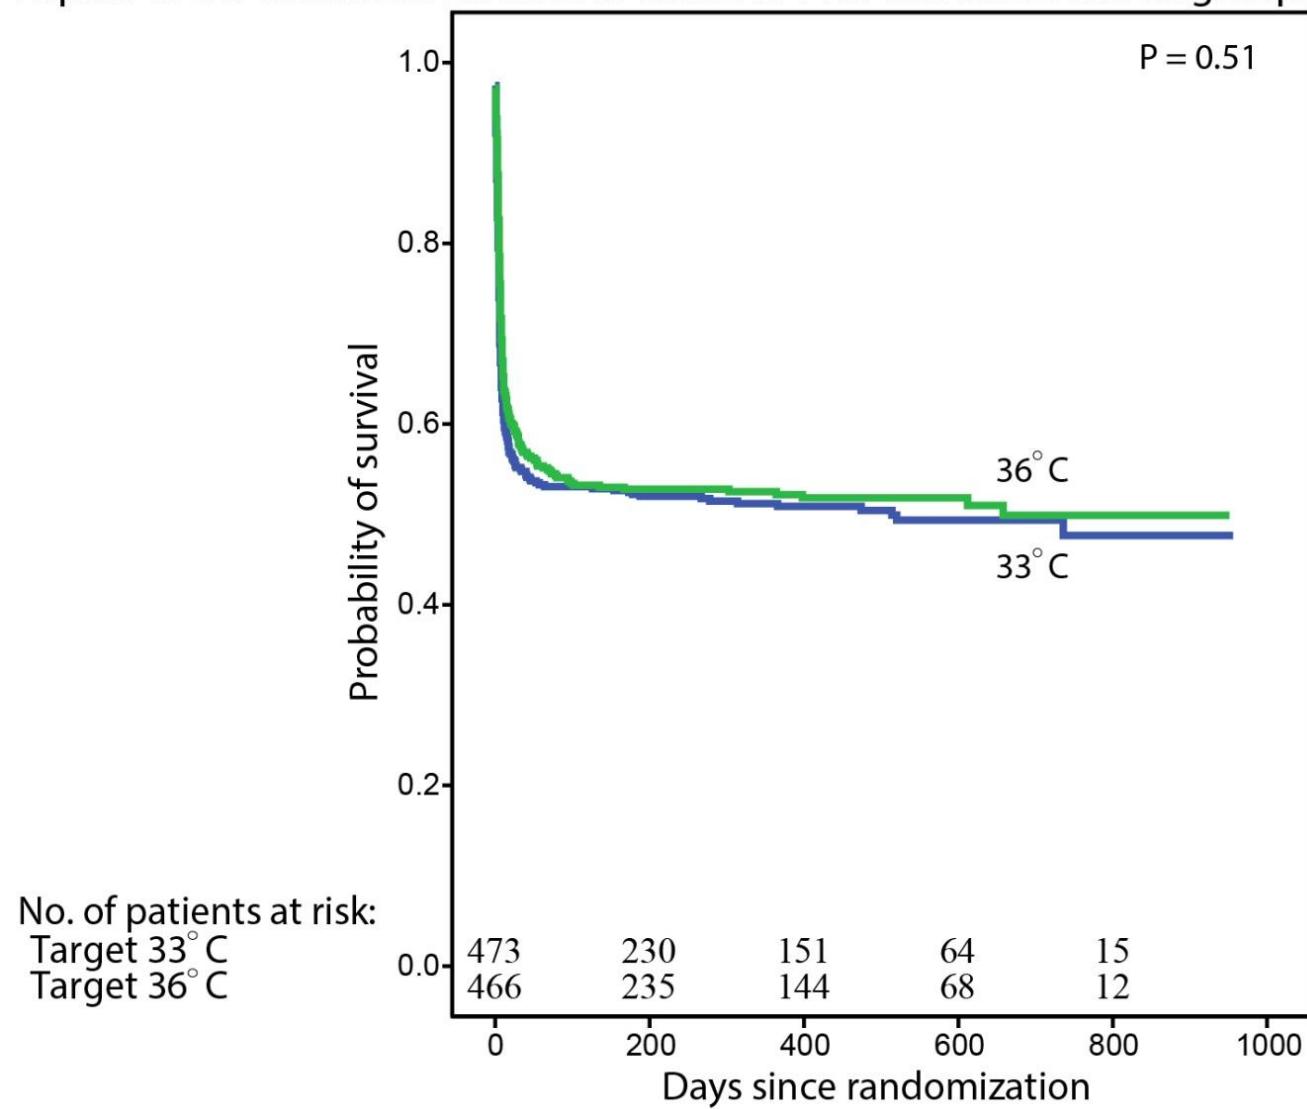

- **Primært outcome:** Overlevelse
- **Sekundært outcomes:** Død og neurologisk status ved 180 dage
 - ✓ Cerebral Performance Category
 - ✓ Modified Rankin Scale
- Serious adverse events

Temp ved ankomst til hospital- 1.2° C

JAMA 2013

Table 3. Prehospital, Emergency Department, and In-Hospital Safety Data

	Intervention	Control	P Value
Rearrest postrandomization ^a	(n = 686) 176 (26) [22 to 29]	(n = 671) 138 (21) [18 to 24]	.008
Use of pressors postrandomization ^a	(n = 686) 62 (9) [7 to 11]	(n = 671) 59 (9) [7 to 11]	.82
Prehospital deaths ^a	(n = 688) 9 (1.3) [0.7 to 2.5]	(n = 671) 11 (1.6) [0.9 to 2.5]	.61
Time from first dispatch to hospital arrival, min ^b	(n = 654) 51 (50 to 52) [13]	(n = 629) 49 (48 to 50) [14]	.006
First arterial blood gas			
pH ^b	(n = 612) 7.16 (7.14 to 7.18) [0.23]	(n = 590) 7.20 (7.18 to 7.22) [0.29]	.005
Pao ₂ , mm Hg ^b	(n = 609) 189 (178 to 200) [135]	(n = 585) 218 (206 to 230) [144]	<.001
Pulmonary edema			
First chest film ^a	(n = 631) 256 (41) [37 to 44]	(n = 609) 184 (30) [27 to 34]	<.001

CONCLUSION AND RELEVANCE Although use of prehospital cooling reduced core temperature by hospital arrival and reduced the time to reach a temperature of 34°C, it did not improve survival or neurological status among patients resuscitated from prehospital VF or those without VF.

Fortolknings muligheder

- 2002-studierne var forkerte. Køling virker ikke.
- TTM underpowered?
- TTM forkerte patienter?
- TTM for langsom nedkøling?
- TTM for hurtig opvarmning?
- Det at undgå feber er nok

Feber efter hypotermibeh

ILCOR og NBV

“We accept that some clinicians may make a local decision to use a target temperature of 36°C pending this further guidance”

NBVen anbefaler ‘terapeutisk hypotermi’ uden angivelse af target temperatur

Thus, the TTM trial should change practice immediately. The compelling evidence from the TTM trial is that patients who have been resuscitated from an out of hospital cardiac arrest and who remain comatose should not receive therapeutic hypothermia (32-34°C) after admission to hospital. Instead, a temperature target of 36°C is appropriate and much more easily achieved. Importantly, prognostication in such patients should be delayed for at least 72 hours after sedation is stopped, except in cases of brain death or early myoclonus with bilaterally absent somatosensory evoked responses. In addition, there seems to be no supportive evidence for active cooling using ice cold intravenous fluid bolus in the prehospital setting.

Prognosticering af cerebralt udkomme hos patienter med manglende opvågning efter hjertestop
